

Exercise 1- My MySpace

Objective: Write an HTML document and style it with a CSS file.

Remember MySpace? Me neither. Even though it was a little before my time, I always loved the idea of having your own web page that evokes your own personal flair. As a result, I want you all to design your own personal website that mimics the purpose of a MySpace page (it does not have to look exactly the same, just serve the same purpose). There are some key requirements listed below. ***Please fill the content with interests, hobbies projects (whatever you would like), but aim to make it as true to your persona as possible.*** On page two I have listed some examples to frame your webpage. Starter code is provided, ***please do not change the file names.***

Core Requirements:

Your html document **must** include:

- Head tag with:
 - Link to CSS
 - Key Words
 - Author
- A heading
- A table
- A list (ordered or unordered)
- A paragraph tag
- An image
- A link
- An iframe to another webpage/video
- Use a div and span tag

Your CSS Stylesheet **must** include:

- Each of the following selectors:
 - 2 class selectors
 - 2 ID selectors
 - A Descendant selector
- **Each selector must have at least 3 style declarations (i.e. color or font size)****
- A colored or pattern background for the entire page

Have fun with it ☺

Examples on next page (not all are MySpace pages).
